## COLOUR GUIDE FOR THE PAD PRINTING PROCESS

Teca-Print proudly presents something completely new: The Teca-Print colour guide for the pad printing process is available now. Never before it has been so easy to choose the suitable colour for your print. All available standard ink tones for the pad printing process are united for the first time in a colour guide.

The colour guides, available until now with the HKS-, Pantone-, RAL- or NCS-colours, have new competition. But our colour guide does not want to call in question the right to exist of these well-known and widespread ink tones and their colour guides. Rather it has been made to complete them in a practical way.

Often the requested colour can be reached with a standard ink tone, which means to save money and time, because the colour does not have to be mixed first with a lot of efforts. Up to now, the standard ink tones often have been forgotten. Who goes to get a catalogue in his office when there is a colour guide directly beside the machine or printing part, in which the required colour is easy to find?

Teca-Print colour guide for the pad printing process, Article-No. 706 001 006

From now on, each user first should take the new Teca-Print colour guide in his hands. The colour cards possess a spacious and generous colour sample for comparisons and show the hole range of standard ink tones in a clearly arranged way. If the suitable ink tone has been found, it means: Open the ink can and start printing! Time and money have been saved.

And should an ink shade be required, which must be mixed according to HKS, Pantone, RAL or NCS: No problem, our colour guide contains the two mixing systems PC and GF with which the ink tones can be mixed with a recipe.

In addition to the standard ink tones and the PC-/GF-mixing system colours, our colour guide shows the metallic colour tones and the glossy metallic colour tones. These metallic colour tones are becoming more and more important due to the increasing demands concerning print and design. Our colour guide also contains the fluorescent colour tones and the process colours. So all the important ink tones for the pad printing process are shown.
